1. INTRODUCTION

1.1. Analysis Overview

The objective of this analysis is to identify critical environmental issues within the Point of the Mountain study area and the environmental regulations that could affect project implementation and broader project viability. To complete this analysis, SWCA Environmental Consultants (SWCA) used two study areas: an approximately 108,000-acre study area that provides a broader landscape context for wildlife and recreation resources within a potential development area and a slightly smaller, targeted study area of approximately 74,500 acres for analysis of land cover, wetlands, aquatic resources, flood zones, and cultural resources (Figure A1, Appendix A). The following resource sections refer only to a single study area, because the larger subsumes the smaller and because a specific study area is resource dependent.

This analysis identifies federal, state, and local permits or authorizations relevant to the proposed development project and provides the Point of the Mountain Development Commission with recommendations for environmental compliance during project implementation. SWCA completed the analysis using available information, including published literature, reports, maps, aerial photographs, databases, public records, and available geographic information system (GIS) datasets. SWCA conducted no fieldwork for the study. The analysis is organized into natural, recreation, and cultural resource sections and concludes with a final risk evaluation and summary.

1.2. Study Area Description

The study area is referenced and characterized by the locally known term *Point of the Mountain*, which is a topographic feature at which the Wasatch Front and Oquirrh Mountains are the closest. This location has depositional features from ancient Lake Bonneville and corresponds roughly to the boundary between Utah and Salt Lake Counties. Running south to north through the middle of the study area is the Jordan River, which flows from Utah Lake to the Great Salt Lake. The study area extends north and south of Point of the Mountain along transportation corridors and into areas of commercial, industrial, and residential development; agricultural areas; and open space and natural areas.

1.3. Data Review and Analysis

SWCA reviewed data from multiple sources that provide information on critical federal, state, and local environmental issues relevant to the project. Not all data were incorporated into the final analysis. This information was compiled, analyzed, and used in the evaluation of risk categories. The sources of these data are provided in Table 1.

Table 1. Review and Analysis Data Types and Sources

Data Type	Data Source
Southwest Regional Gap Project (SWReGAP)	Lowry (2007)
Soil Survey Geographic (SSURGO)	Natural Resources Conservation Service (2016)
National Hydrography Dataset	U.S. Geological Survey (2016)
National Wetlands Inventory	U.S. Fish and Wildlife Service (2014)
Water-related land use	Utah Division of Water Resources (2010)
Flood Insurance Rate Map Data	Federal Emergency Management Agency (2016)

Table 1. Review and Analysis Data Types and Sources

Data Type	Data Source
Southwest Regional Gap Project (SWReGAP)	Lowry (2007)
Big game species	Utah Division of Wildlife Resources (DWR) (2015a)
Sage-grouse habitat	DWR (2013, 2016a)
Prairie dog habitat	Automated Geographic Reference Center (AGRC) (n.d. [2016a])
Trails	AGRC (2016b)
Recreation locations	Utah State Parks and Recreation Landmark Features (Utah Division of Parks and Recreation 2017), golf courses (AGRC 2016c), local parks (AGRC 2016d)
Cultural resources	Utah State Historic Preservation Office data

1.4. Permits, Compliance, and Authorizations

SWCA reviewed regulatory requirements for entities with jurisdiction over resources or facilities within the study area. Table 2 provides a list of the major federal, state, and local permits, compliance, and authorizations that could be required before or during implementation of projects associated with Point of the Mountain development. As applicable, Table 2 also provides application processing times and associated general fees.

Table 2. Federal, State, and Local Permits, Compliance, and Authorizations Potentially Applicable to the Project

Permits, Compliance, and Authorizations	Rationale for Permits, Compliance, and Authorizations	Authority	Application Processing Time	General Fee*	Statutory Reference
FEDERAL					
Natural Resources					
Endangered Species Act (ESA) compliance	Protection of endangered species	U.S. Fish and Wildlife Service (USFWS)	Not applicable	Not applicable	ESA (Public Law [PL] 93-205, as amended by PL 100-478 [16 United States Code (USC) 1531 et seq.]) Utah Administrative Code R930-7-8 (2a) Utility Accommodation
Migratory Bird Treaty Act compliance	Protection of migratory birds	USFWS	Not applicable	Not applicable	16 USC 703–711 50 Code of Federal Regulations (CFR) Subchapter B
Bald and Golden Eagle Protection Act compliance	Protection of bald and golden eagles and their nests	USFWS	Not applicable	Not applicable	16 USC 668–668(d)
Water Resources					
Clean Water Act (CWA) Section 404 Dredge and Fill Permit	Discharge of fill material into waters of the U.S.	U.S. Army Corps of Engineers	60 days for Nationwide Permit	Not applicable	40 CFR 230 Utah Administrative Code R930-7-8 (2a) Utility Accommodation
STATE					
Natural Resources					
State sensitive species	Avoidance and minimization of impacts to state sensitive species for state-sanctioned projects	Required for projects with a state-nexus	Not applicable	Not applicable	UDOT 08A2-04 Environmental Policy for State Projects Utah Administrative Code R930-7-8 (2a) Utility Accommodation
Water Resources					
Stream alteration permit	Alteration of any natural, named stream or stream deemed significant	Utah Division of Water Rights	20-day circulation period	\$500 application fee	
Sovereign Land Authorizations	General permits, leases, easements, and rights of entry for projects affecting the bed and banks of the Jordan River.	Forestry, Fire & State Lands	60 to 90 days	Variable	R652-70-300

Table 2. Federal, State, and Local Permits, Compliance, and Authorizations Potentially Applicable to the Project

Permits, Compliance, and Authorizations	Rationale for Permits, Compliance, and Authorizations	Authority	Application Processing Time	General Fee*	Statutory Reference
CWA Section 402 National Pollutant Discharge Elimination System during construction	Construction sites with greater than 1 acre of land disturbance	Utah Department of Environmental Quality (UDEQ)	Not applicable	Not applicable	40 CFR 230 Utah Administrative Code R930-7-8 (2a) Utility Accommodation
Discharge permit, spills (Utah Pollutant Discharge Elimination System)	Construction and operation	UDEQ	Not applicable	Not applicable	Utah Code 19-5
Section 401 Certification	Potential discharge into waters of the state, including wetlands and washes	UDEQ	Not applicable	Not applicable	Utah Administrative Code R317-15 CWA (33 USC 1344)
Cultural Resources					
National Historic Preservation Act	Compliance with NHPA if federal funding or federal nexus exists Administered by the State of Utah	Antiquities Section, Utah Division of State History	Not applicable	Not applicable	
Consultation with state agency regarding treatment of human remains and funerary objects	Discovery of graves, associated funerary objects, sacred objects, and items of cultural patrimony on non-federally owned and non-state-owned land	Antiquities Section, Utah Division of State History	Not applicable	Not applicable	Utah Code 9-8-309 Utah Administrative Code R930-7-8 (2a) Utility Accommodation
Abuse or desecration of a dead human body	Discovery of graves	Law enforcement	Not applicable	Not applicable	Utah Code 76-9-704 Utah Administrative Code R930-7-8 (2a) Utility Accommodation
Report of discovery on state and private lands	Impact on archaeological sites	Utah Division of State History	Not applicable	Not applicable	Utah Code 9-8-307 Utah Administrative Code R930-7-8(2a) Utility Accommodation
COUNTY AND LOCAL					
Interdepartmental city authorizations	Inter-department municipal review	Local city and county government	Not applicable	Not applicable	Not applicable
Flood Control	For projects within 20 feet of the Jordan River to assess flood zone issues	Salt Lake County Flood Control	Not applicable	Not applicable	Not applicable

* Additional fees may be required (e.g., performance and warranty bonds, insurance requirements, inspection fees).

2. NATURAL RESOURCES

2.1. Assessment and Findings

2.1.1. Land Cover and Use

SWCA used GIS to map land cover types in the study area (Table 3). The distribution of the 10 land cover types in the study area is shown in Figure A2 in Appendix A. The land cover types listed in this report are consolidated from Southwest Regional Gap Analysis Project (SWReGAP) land cover type definitions (USGS 2005). Land cover types are combined where multiple dominant vegetation communities intersect.

Table 3. Land Cover Type Acreages and Percentages and Habitat Descriptions in the Study Area

Land Cover Type	Acres and Percentages in the Study Area	Description
Agriculture	31,773 (43%)	Cropland and grazing areas
Developed	32,736 (44%)	High-, medium-, and low-intensity development with some neglected open space and mine or quarried areas
Woodland	2,250 (3%)	Great Basin and Rocky Mountain coniferous and deciduous forest areas
Riparian	2,333 (3%)	Lower montane or lowland riparian zones
Shrubland	2,460 (3%)	Intermountain sagebrush and salt desert shrublands
Native Grassland	349 (< 1%)	Herbaceous areas characterized by native species
Invasive Grass and Forbland	1,836 (2%)	Herbaceous areas characterized by native species, grasses, and broadleaf plants
Emergent Marsh	715 (1%)	Wetlands with emergent vegetation, often in a mosaic of open water
Open Water	70 (< 1%)	The Jordan River, its tributaries, and ponded areas
Cliff and Canyon	13 (< 1%)	Steep slopes in the foothills of the Wasatch and Oquirrh Mountains
Total	75,535 (100%)	

The dominant land cover types in the study area are agriculture (43%) and developed (44%). Natural land cover types in the study area (<13%) include woodland, shrubland, riparian, emergent marsh, and cliff and canyon. Opportunities to enhance habitat exists through restoration and treatment of invasive weeds.

Waters of the U.S.

Section 404 of the Clean Water Act (CWA) is a regulatory driver that transcends landownership and requires that the discharge of dredged or fill material to waters of the U.S. (WOUS) be avoided or minimized as practicable. The U.S. Army Corps of Engineers (USACE) and the U.S. Environmental Protection Agency share joint responsibility for implementation of this regulation, with permitting duties falling primarily to the former. From an ecological perspective, common WOUS can include wetland and stream habitat types but may also include mudflats, playas, ponds, and canals.

The USACE typically asserts jurisdiction over perennial and intermittent streams as well as wetlands abutting or adjacent to those features. Ephemeral streams or washes in the arid western United States may also be regulated if they possess indicators of ordinary high water and significantly affect the chemical, physical, and biological integrity of a downstream jurisdictional water. Erosional features characterized by low volume, infrequent flow, or short duration are not regulated. Many streams in Utah are also considered waters of the state, for which separate jurisdictional criteria exist. The State of Utah asserts jurisdiction over “blue-line” streams on topographic maps, those that have a common name used on maps, and streams supporting xeric-riparian vegetation communities.

SWCA used publically available geospatial data from the U.S. Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI), the U.S. Geological Survey (USGS) National Hydrography Dataset (NHD), and aerial imagery to conduct an analysis of potential WOUS and waters of the state in the study area.

More than 1,500 acres of riverine, ponded, marsh, shrub, and forested wetlands exist within the study area (Figure A3, Appendix A; Table 4). These wetlands are located primarily along the Jordan River and some of the larger canals in the study area. In addition to canals, which can be regulated under the CWA, many tributaries to the Jordan River and other linear features flow through the study area.

Table 4. Aquatic Resources in the Study Area

National Wetland Inventory Wetlands	Acres
Ponded Wetlands	71
Emergent Marsh and Wetland Meadows	835
Forested and Shrub Wetlands	217
Other Wetlands	70
Riverine Resources	324
Total	1,517
National Hydrography Dataset Linear Features	Feet
Canal/Ditch	750,236
Stream/River	553,705
Pipelines, Connectors and Artificial Flow Paths	195,253
Total	1,499,194

Floodplains

A flood hazard zone is an area that has been identified on a Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map as being prone to inundation. FEMA defines flood zones according to risk. Each zone reflects the severity or type of flooding in a given area. SWCA reviewed FEMA flood zone data for Salt Lake and Utah Counties (FEMA 2016).

Within the study area are locations that fall under the FEMA categories Zone A, Zone X (500 year), and Zone X (Figure A4, Appendix A; Table 5). Zone A areas lie within the 100-year floodplain. Zone X (500 year) areas lie within 100-year or 500-year flood zones but are protected by levees. Zone X areas lie outside any 100-year and 500-year flood zones. Flood zones in the study area are associated with Utah Lake, the Jordan River, and tributaries of the Jordan River. The Jordan River 100-year flood zone is widest in the vicinity of Point of the Mountain.

Table 5. Flood Zones in the Study Area

FEMA Flood Zone	Acres
Zone A	3,439
Zone X (500 year)	1,368
Zone X	69,309
Not mapped	419
Total	74,535

2.1.2. Special-Status Wildlife

The USFWS has jurisdiction over all species listed under the Endangered Species Act (ESA), all migratory bird species (including raptors and eagles) protected under the Migratory Bird Treaty Act (MBTA), and golden and bald eagles protected under the Bald and Golden Eagle Protection Act (BGEPA). These regulations uniformly apply to development, regardless of whether federal land, money, or permits are involved. Therefore, the ESA, MBTA, and BGEPA apply to potential Point of the Mountain development.

The USFWS regulates the protection of active raptor nests as prescribed in the *Utah Field Office Guidelines for Raptor Protection from Human and Land Use Disturbance* (Romin and Muck 2002). These guidelines establish spatial buffers for active nests based on the species. Active passerine nests are also spatially buffered according to USFWS recommendations, which the agency provides on a case-by-case basis through consultation.

To assess the potential impacts of the proposed project on wildlife, SWCA collected data from several sources.

- SWCA accessed the October 1, 2015, Utah sensitive species list on January 16, 2017 (DWR 2015b). Utah sensitive species include federally listed species, candidates for federal listing, species for which a conservation agreement is in place, and species of concern.
- SWCA reviewed GIS data layers for Utah sensitive species, greater sage-grouse, and big game habitat on January 16, 2017 (DWR 2015a, 2015c, 2016a).
- SWCA used raptor nest location data from previous SWCA assessments within the study area; those nests may or may not be currently active. Additional nests likely exist in the study area.

Most of the raptors that could be present in the study area, with the exception of the peregrine falcon (*Falco peregrinus*), are afforded a maximum buffer of 0.5 mile (Romin and Muck 2002). SWCA's recommendations for clearance surveys strictly follow USFWS guidelines (see Section 2.2.). Once project-specific consultation is initiated, more lenient interpretations of the restricted periods may apply to this project.

Federally Listed Species and Utah Sensitive Species

Species protected under the ESA and other Utah state sensitive species that occur in Salt Lake and Utah Counties were assessed for their potential to occur in the study area based on their habitat requirements relative to land cover types in the study area (Table 6). Known occurrences have been catalogued by the DWR in a conservation database. Appendix B contains the results of a search of this database.

Table 6. Federally Listed Wildlife Species and Utah State Sensitive Wildlife Species for Salt Lake and Utah Counties and Their Potential to Occur in the Study Area

Common Name	Scientific Name	Status	Potential to Occur in the Study Area and Rationale
Birds			
Northern goshawk	<i>Accipiter gentilis</i>	CS	No. Suitable forest habitat is not present in the study area.
Grasshopper sparrow	<i>Ammodramus savannarum</i>	SPC	Low. Some grassland is in the study area; however, the potentially suitable habitat is weedy and fragmented.
Short-eared owl	<i>Asio flammeus</i>	SPC	Low. Although this owl is usually found in grassland areas, potentially suitable habitat in the study area is very weedy and urban, which makes this species unlikely to nest in the study area. This species can be observed foraging or migrating along the Jordan River in the spring, summer, and fall. Historical records of occurrence for this species in the wildlife study area are documented in Appendix B.
Burrowing owl	<i>Athene cunicularia</i>	SPC	High. This species is found in open, dry, treeless range and farmland and prefers arid grasslands and shrublands of the Great Basin. The species is found in Salt Lake Valley, e.g., near Salt Lake Airport #2 (DWR 2016b). Historical records of occurrence for this species in the wildlife study area are documented in Appendix B. SWCA has found active nest locations in the study area.
Ferruginous hawk	<i>Buteo regalis</i>	SPC	Low. Suitable nesting and foraging habitat for this desert species is limited in the study area.
Yellow-billed cuckoo	<i>Coccyzus americanus</i>	S-ESA	Moderate. This species is rare along the Jordan River and occurs only in the summer (Olson 2015). Additionally, there are eight records of cuckoos being taken by the nesting peregrine falcons (<i>Falco peregrinus</i>) in downtown Salt Lake City. Seven of these were documented between 1986 and 1993, but the most recent was documented on July 4, 2014. (Pope 2015). It is unknown if these taken cuckoos were from the Jordan River or if they were nesting or migrating at the time they were taken. Historical records of occurrence for this species in the wildlife study area are documented in Appendix B.
Black swift	<i>Cypseloides niger</i>	SPC	No. No waterfall type habitat occurs in the study area.
Bobolink	<i>Dolichonyx oryzivorus</i>	SPC	Low. Potential suitable wet meadow habitat is in the study area.
Bald eagle	<i>Haliaeetus leucocephalus</i>	SPC	Low. Suitable nesting, roosting, or foraging habitat is present in the study area, although there are no known nesting locations in the study area.

Table 6. Federally Listed Wildlife Species and Utah State Sensitive Wildlife Species for Salt Lake and Utah Counties and Their Potential to Occur in the Study Area

Common Name	Scientific Name	Status	Potential to Occur in the Study Area and Rationale
Lewis's woodpecker	<i>Melanerpes lewis</i>	SPC	Moderate. This species has been documented as a rare permanent resident of the Jordan River (Olson 2015). Historical records of occurrence for this species in the wildlife study area are documented in Appendix B.
Long-billed curlew	<i>Numenius americanus</i>	SPC	Moderate. This species can be observed along the Jordan River in the spring, summer, and fall. The species prefers short-grass habitats, including shortgrass and mixed-grass prairies as well as agricultural fields. Recent records of occurrence for this species in the study area are documented in Appendix B.
American white pelican	<i>Pelecanus erythrorhynchos</i>	SPC	Low. This species can be observed year-round foraging along or flying over the Jordan River. Historical records of occurrence for this species in the wildlife study area are documented in Appendix B.
American three-toed woodpecker	<i>Picoides dorsalis</i>	SPC	No. No conifer-aspen forest habitat exists in the study area.
Greater sage-grouse	<i>Centrocercus urophasianus</i>	SPC	Low. While sagebrush areas exist within the study area, no known nesting areas are present. Historical records of occurrence for this species in the wildlife study area are documented in Appendix B.
Fish			
Least chub	<i>Lotichthys phlegethontis</i>	CS	No. Although the study area is historic range for this species, surveys have only identified populations outside the study area (DWR 2005).
Southern leatherside chub	<i>Lepidomeda aliciae</i>	SPC	No. The historic range of this species consists of southern tributaries of the Utah Lake Basin (DWR 2010).
June sucker	<i>Chasmistes liorus</i>	S-ESA	No. This is a lake species that can be found in surrounding rivers. However, the species could occur in the upper reaches of the Jordan River.
Bonneville cutthroat trout	<i>Oncorhynchus clarkii utah</i>	CS	Low. This species is generally found in headwater streams and high-elevation tributary creeks in the Bonneville Basin (Bosworth 2003). Although individuals might be found at lower elevations, streams in the study area do not represent good habitat.
Colorado River cutthroat trout	<i>Oncorhynchus clarkii pleuriticus</i>	CS	No. Current populations are known in the Green and Colorado Basins (DWR 2016c).
Bluehead sucker	<i>Catostomus discobolus</i>	CS	No. Historically found in Weber, Ogden, and Bear River drainages of the Bonneville Basin, this modern occupied range of this species is the Upper Colorado River Basin (DWR 2006).
Roundtail chub	<i>Gila robusta</i>	CS	No. Current populations are known in the Green and Colorado Basins. (Bosworth 2003; DWR 2006).
Mammals			
Townsend's big-eared bat	<i>Corynorhinus townsendii</i>	SPC	Low. Although this species can occur throughout the state at elevations below 9,000 feet, this species roosts in caves and mines (Bosworth 2003). Given the urban/suburban nature of the study area, it is assumed that these habitats are not present.
Fringed myotis	<i>Myotis thysanodes</i>	SPC	Moderate. Some authors have considered the species to be statewide in distribution. Individuals have been encountered in varied habitats, including mixed conifer and aspen, desert riparian, and pinyon-juniper. Populations tend to be associated with areas with rocky outcroppings, cliffs, and canyons. This species most likely migrates by the Jordan River.

Table 6. Federally Listed Wildlife Species and Utah State Sensitive Wildlife Species for Salt Lake and Utah Counties and Their Potential to Occur in the Study Area

Common Name	Scientific Name	Status	Potential to Occur in the Study Area and Rationale
Spotted bat	<i>Euderma maculatum</i>	SPC	No. This species is primarily found in eastern and southern Utah. Typical habitat includes deep, narrow, rocky canyons, which are not present in the study area (Bosworth 2003).
Western red bat	<i>Lasiurus blossevillei</i>	SPC	Low. Little is known about the habitat requirements of this species. There have been scattered occurrences in Utah County.
Grizzly bear	<i>Ursus arctos</i>	S-ESA	No. Extirpated. No further analysis is required because of the complete lack of potential habitat and the documented extirpation.
White-tailed prairie-dog	<i>Cynomys leucurus</i>	SPC	No. Populations have been documented in northeastern Utah, including Rich County, the Uintah Basin, and northern Colorado Plateau.
Kit fox	<i>Vulpes macrotis</i>	SPC	No. Suitable open prairie and desert habitat for this species is no longer present in the study area. Historical records of occurrence for this species in the wildlife study area are documented in Appendix B.
Canada lynx	<i>Lynx canadensis</i>	S-ESA	Low. The hypothetical range includes the Wasatch Mountains (Bosworth 2003), but it is unlikely that this species would be found within the highly urbanized study area.
Mollusks			
California floater	<i>Anodonta californiensis</i>	SPC	No. This species is known to occur in the Jordan River watershed, but water quality conditions in the part of the river within the study area would likely not support this mollusk.
Western pearlshell	<i>Margaritifera falcata</i>	SPC	No. Suitable riverine habitat is not present in the study area. Water quality present in study area canals would likely not support this species.
Eureka mountainsnail	<i>Oreohelix eurekaensis</i>	SPC	No. This species occurs in the mountainous areas of northern Utah (Oliver and Bosworth 1999).
Lyrate mountainsnail	<i>Oreohelix haydeni</i>	SPC	No. No limestone habitat or calcareous soils occur in the study area.
Southern Bonneville springsnail	<i>Pyrgulopsis transversa</i>	SPC	Low. The species is known from six springs in north-central Utah. Springs within the study area, even if disturbed, could provide suitable habitat but are likely outside the range of this species.
Utah physa	<i>Physella utahensis</i>	SPC	No. Historically this species occurred in Utah Lake and associated springs but is now thought to be extirpated (Oliver and Bosworth 1999).
Herptiles			
Western (boreal) toad	<i>Bufo boreas</i>	SPC	No. According to the DWR statewide monitoring summary for 2008 (DWR 2009), no known populations occur near the Jordan River.
Smooth greensnake	<i>Opheodrys vernalis</i>	SPC	Low. This species tends to occur in mountainous habitats but can be found in meadows, wetlands, and grasslands (Bosworth 2003). Potentially suitable habitat occurs in the study area, but given the elevation, populations are less likely to occur.
Columbia spotted frog	<i>Rana luteiventris</i>	CS	No. This species historically occurred on the Jordan River and at lower elevations along the Wasatch Front, but wetland destruction associated with urban expansion resulted in loss of populations (Bosworth 2003). Historical records of occurrence for this species in the wildlife study area are documented in Appendix B.

Note: CS = species receiving special management under a conservation agreement to preclude the need for federal listing; S-ESA = federally listed or candidate species under the Endangered Species Act; SPC = wildlife species of concern.

Activities in the study area could affect three wildlife species managed by the Endangered Species Program: June sucker (*Chasmistes liorus*), yellow-billed cuckoo (*Coccyzus americanus*), and Canada lynx (*Lynx canadensis*). Study area habitat types/locations for these species include the Jordan River (June sucker), large riparian areas adjacent to the Jordan River (yellow-billed cuckoo), and undeveloped open space in the foothills of the Wasatch Mountains (Canada lynx). In all, four Utah wildlife species of concern and one conservation agreement species have a moderate to high potential to occur in the study area. These consist of long-billed curlew (*Numenius americanus*), burrowing owl (*Athene cunicularia*), Lewis's woodpecker (*Melanerpes lewis*), and fringed myotis (*Myotis thysanodes*).

Migratory Bird Treaty Act and Bald Eagle and Golden Eagle Protection Act Species

Raptors

Suitable nesting substrate for raptors exists in and within 0.5 mile of the study area (Figure A5, Appendix A). This substrate exists in the form of trees, cliffs, and/or transmission lines. SWCA reviewed raptor nest location data from previous SWCA assessments in the study area. These previously recorded nests may or may not be currently active and comprise burrowing owl, common raven, golden eagle, great horned owl, long-eared owl, and red-tailed hawk.

Big Game Species

SWCA reviewed DWR GIS big game species habitat data layers for the study area (DWR 2015a). Crucial habitat for mule deer (*Odocoileus hemionus*), pronghorn (*Antilocapra americana*), and Rocky Mountain elk (*Cervus elaphus*) exist within the study area (see Figure A5, Appendix A; Table 7). These habitats correspond with mountainous areas on the east and west sides of Point of the Mountain. Given the proximity of these two areas of crucial habitat, one might expect a migration corridor to exist at this location. However, steep slopes, the Jordan River, and Interstate 15 likely limit east-to-west movement of big game. Anecdotal evidence suggests that big game move north to south in the vicinity of Point of the Mountain. Wildlife collision data from January 30, 2015, to January 30, 2017, consolidated by the Utah Department of Transportation (UDOT) illustrate greater mortality along portions of State Route 85 (Mountain View Parkway), State Route 68 (Redwood Road), and State Route 92 (near Alpine and Highland, Utah (Figure A6, Appendix A). Collisions appear to be a function of both new and existing roads adjacent to undeveloped areas or constructed within wildlife habitat or migration corridors. Collision data are for a wide range of wildlife species beyond big game, although they reflect primarily mule deer mortality. Red diamonds on Figure A6 indicate single mule deer collisions.

Table 7. Big Game Crucial Habitat in the Study Area

Habitat	Acres
Mule Deer – Winter Crucial	19,059
Pronghorn – Year-long, Crucial	77
Rocky Mountain Elk – Winter, Crucial	4,390
Total	23,526

Predators

The primary predator of concern within the planning area is the cougar (*Puma concolor*). Statewide planning goals for this species include maintaining healthy cougar populations within their current distribution while also considering human safety, economic concerns, other wildlife species, and hunting traditions (DWR 2015a). Factors that support healthy populations include but are not limited to habitat condition and balance with natural prey. The Oquirrh Mountains on the west side of the planning area provide habitat for cougars and have been used for recent research studies. This area is a patchwork of private properties with various uses, including military training, industrial mining, and suburban development. This habitat also supports big game, which is a component of cougar diet. Cougar tracking studies referenced in the *Utah Cougar Management Plan V.3 2015–2025* (DWR 2015c) indicate that:

- Cougars are farthest from human-dominated landscapes during the day and closest at night when actively hunting (Reith 2009).
- Cougars generally avoid areas of predictable human activity. However, male cougars and older females with dependent kittens occasionally use human-dominated landscapes (Stoner 2011).
- Despite cougar proximity to human dominated landscapes, depredation on pets and hobby livestock is rare. Most depredation occurs on free-ranging cattle in wilderness areas (Mitchell 2013).

Given these findings it is possible that expansion of human-dominated landscapes, decreases in habitat quality, and imbalances in predator/prey populations can exacerbate conflicts between humans and cougars. Suburban Los Angeles, California, and Boulder, Colorado, provide modern-day scenarios of human/cougar interaction that may one day characterize the Point of the Mountain Development study area.

2.1.3. Special-Status Plants

Projects conducted entirely on private land and without a federal nexus do not need to comply with the ESA's requirements for special-status plant species. However, projects on federal land, implemented with federal money, or requiring a federal permit must comply. SWCA conducted an ArcGIS-based desktop analysis of available spatial data to identify and map the distributions of land cover, vegetation communities, and special-status plant species. SWCA reviewed land cover databases such as SWReGAP (USGS 2005) and recent aerial imagery to determine the land cover types and vegetation communities associated with the study area. The following section summarizes any special-status plant species that may occur in the study area.

Federally Listed Species

One federally listed plant species, Ute ladies'-tresses (*Spiranthes diluvialis*), has the potential to occur in the study area (Table 8). Ute ladies'-tresses are known to occur historically in Salt Lake County, but there are no recent records of occurrence (Fertig et al. 2005). Known populations do exist in Utah County. The canals and wetland habitat identified in the NWI and NHD datasets could meet the habitat requirement criteria for Ute ladies'-tresses.

Table 8. Federally Listed Plant Species for Salt Lake and Utah Counties and Their Potential to Occur in the Study Area

Common Name	Scientific Name	Status	Potential to Occur in the Study Area and Rationale
Ute ladies'-tresses	<i>Spiranthes diluvialis</i>	S-ESA	Moderate. This species occurs in moist to very wet meadows; near seeps, springs, and lake shores; and along streams and abandoned stream meanders below 6,500 feet.

Note: S-ESA = federally listed or candidate species under the Endangered Species Act.

2.2. Compliance and Recommendations

2.2.1. Land Cover and Use

Waters of the U.S.

Additional Work Required

If future development avoids wetlands and other WOUS, no report or consultation with USACE would be required. Projects with anticipated impacts to wetlands and WOUS should involve wetland delineation to obtain a jurisdictional determination from the USACE.

Permitting

Temporary or permanent placement of fill material into wetlands and other WOUS is regulated under CWA Section 404 and enforced by the USACE. Development that impacts surface waters will require authorization. Since the Jordan River is a water of the state and the bed and banks are sovereign land, authorization for associated development is also required by the Utah Division of Water Rights (Stream Alteration Permit) and Forestry, Fire & State Lands (easement, lease, or general permit).

Floodplains

Additional Work Required

Work along the Jordan River and its tributaries has the potential to impact flood zones. Revision of flood maps can be initiated by the community or by FEMA.

Permitting

Salt Lake County issues flood control permits through its flood control program. Although Utah County does not issue flood control permits, coordination with the county regarding work in the flood zone is recommended.

2.2.2. Special-Status Wildlife

SWCA conducted a desktop analysis to determine if there is potential for special-status wildlife species to occur in or near the study area. For project compliance with the MBTA and BGEPA, bird/nest clearance surveys should occur before project implementation to verify the presence or absence of nesting raptors and other migratory birds. A summary of the species that SWCA identified as requiring additional survey for regulatory compliance and associated recommendations follows.

Federally Listed Species and Utah Sensitive Species

Three federally listed endangered, threatened, or candidate wildlife species have the potential to occur in the study area: June sucker, yellow-billed cuckoo, and Canada lynx (see Table 6). However, compliance with the ESA and the unlikelihood that individuals or critical habitat would be impacted by Point of the Mountain development would allow individual projects to move forward.

Four Utah sensitive wildlife species have moderate potential to occur in the study area: long-billed curlew, burrowing owl, Lewis's woodpecker, and fringed myotis. As a result, a project with a state nexus might require field-based surveys to determine if populations of these species are present. However, compliance with state regulations and the unlikelihood that these species or habitat would be affected by Point of the Mountain development would allow individual projects to move forwards.

Migratory Bird Treaty Act and Bald and Golden Eagle Protection Act Species

Raptors

Suitable raptor nesting habitat exists in and within 0.5 mile of the study area (see Figure A4, Appendix A). If project construction occurs in October, November, or December (outside the raptor nesting season, which takes place from January 1 to September 30), no preconstruction clearance surveys would be required. If project construction occurs during the nesting season, clearance surveys would be required immediately before construction (approximately 7 days) for MBTA and BGEPA compliance. These recommendations strictly follow USFWS guidelines (Roman and Muck 2002); when project-specific consultation is initiated, more lenient interpretations of the restricted periods may apply to this project.

Surveying the study area immediately before construction would serve to identify any new raptor nests and any existing raptor nests that have become active in the interim. If no active nests are identified, construction can start as planned. If active nests are identified, the USFWS should be consulted regarding spatial buffers and other potential mitigation. The size of the spatial buffers is specific to the species and can range from 0.25 to 1.00 mile (Roman and Muck 2002). If active nests are identified during ongoing construction, they should be reported to the USFWS immediately to initiate consultation regarding spatial buffers and other potential mitigation. USFWS may be consulted in an effort to reduce buffers, although other requirements, such as a biologist monitoring the nest, may be apply to such an exception. Each spatial buffer is enforced until the young raptor(s) has fledged or until the nest fails naturally. Although additional work may be required to avoid or mitigate impacts to nesting raptors, if advanced planning and mitigation occur, the issue is likely not critical.

Burrowing Owl

For MBTA compliance, suitable habitat within the project area, once it is identified, should be surveyed for burrowing owls 1 week before construction begins. Although the burrowing owl is considered a raptor and is protected by the MBTA, the species receives special consideration because it is only raptor that nests underground in burrows made by other species such as prairie dogs, badgers, and other burrowing animals. The difference in nesting habits requires different nest survey protocols.

Preconstruction burrowing owl surveys should be completed if construction takes place during the nesting season (March 1 to August 31). If an active burrowing owl nest is identified during the survey, project construction should not occur within 0.25 mile of the burrow (Roman and Muck 2002). For construction planned to occur during the breeding season, guidelines recommend clearing the project area of

vegetation and grading the area before the breeding season begins. This would minimize the risk of burrowing owls inhabiting the sites.

Although additional work may be required to avoid or mitigate impacts to burrowing owls, with advanced planning, the issue is likely not critical.

General Passerines

Active migratory passerine nests are afforded protection under the MBTA. Suitable nesting habitat for passerines exists in the study area, and multiple species of migratory passerines could nest within it.

For MBTA compliance, if construction occurs during the passerine nesting period (March 15 to August 15), a 100% coverage survey of suitable passerine habitat should be completed before construction begins to ensure that no active nests are present. If construction is scheduled to occur during the passerine nesting season, the project area can be cleared of vegetation and graded before the nesting season to minimize the risk of passerines nesting in the project area. It should be noted, however, that even if the area is cleared and graded before the nesting season, a few passerine species, such as killdeer (*Charadrius vociferus*), will nest on bare ground. Therefore, to comply with the MBTA, preconstruction clearance surveys should be completed before construction during the nesting season.

If active passerine nests are identified during the survey, project construction should not occur within the USFWS-recommended buffers. Buffers for nesting passerine are significantly smaller than those for nesting raptors and are specified through consultation with the USFWS on a case-by-case basis. Generally, the USFWS will recommend a 50- to 100-foot buffer for active passerine nests. Although additional work may be required to avoid or mitigate impacts to general passerines, with advanced planning, the issue is likely not critical.

Summary of Potential Preconstruction Avian Survey Requirements

Generally, if construction is scheduled to take place outside the nesting seasons for raptors, burrowing owls, and passerines, preconstruction surveys would not be needed. If construction is scheduled to take place during the nesting season, preconstruction surveys should be completed. Table 9 summarizes the survey requirements for raptors, burrowing owls, and general passerines. Unless all construction can be completed in October, November, and December, preconstruction avian surveys of some kind would be recommended.

Table 9. Summary of Avian Survey Requirements

Survey Type	Nesting Season	Non-Nesting Season	Requirement
Raptor surveys	January 1 to September 30	October 1 to December 31	Preconstruction clearance surveys if construction takes place during nesting season
Burrowing owl surveys	March 1 to August 31	September 1 to February 28	
General passerine surveys	March 15 to August 15	August 16 to March 14	

Big Game and Predator Species

Future development in the study area should consider big game and predator habitat and migration corridors. While these species are not federally protected, an understanding of these populations can avoid human/wildlife conflict. Of concern to future residents might be depredation of gardens and landscape plants by big game and pets by cougars. Of concern to wildlife management agencies and other entities is supplemental winter feeding of deer and increased mortality as a result of vehicle strikes. Humans often

engage in supplemental feeding out of kindness, but the practice can facilitate the spread of disease; concentrate numbers, which can damage the environment and attract predators; and cause long-term, negative effects on behavior. UDOT-compiled data already recognize some vehicle collision hotspots (see Figure A6, Appendix A). Future development should look closely at existing migration corridors and conserve adequate open space to allow for wildlife movement.

2.2.3. *Special-Status Plants*

Federally Listed Species

One federally listed plant species—Ute ladies'-tresses—has the potential to occur in the study area. Population surveys for this plant species typically occur as a result of the CWA Section 404 permitting process because of unavoidable impacts to wetlands, which are suitable habitat for the species. The survey window is based on the flowering period for the plant, which ranges from mid-July to early September. Currently, the USFWS is considering removing Ute ladies'-tresses from the Endangered Species List.

3. RECREATION RESOURCES

3.1. Assessment and Findings

3.1.1. Trails

The study area benefits from many existing recreation resources. Among them are approximately 150 miles of surface trails associated with residential development, canal alignments, and reclaimed railroad corridors (Figure A7, Appendix A). The Jordan River Trail is the primary north-south-running non-vehicular transportation corridor. The trail is continuous from Utah Lake to Davis County, with the exception of a few small gaps, one of which is between 14600 South and 15000 South. Salt Lake County prepared a Jordan River Trail Master Plan in 2008 and is currently revising this document, which will include information on not only the surface trail but also the Jordan River as a water trail. The Jordan River Commission provides information to users on boating the Jordan River. Figure A7 in Appendix A identifies segments of the Jordan River where boating is recommended or strongly discouraged. In most cases, safe boat access (put in and take out) exists at the beginning and end of recommended segments, some of which are located in the vicinity of Bangerter Highway.

3.1.2. Other Recreation Sites

Included in the study are six golf courses, numerous parks and open spaces of varying sizes, and the Flight Park State Recreation Area, as illustrated in Figure A6 in Appendix A. These resources are dispersed throughout the study area. In September 2015, Salt Lake County adopted a Parks and Recreation Master Plan. The main themes that emerged during this process were:

- Build new walking, hiking and biking trails,
- Build multipurpose sports fields,
- Ensure a higher level of park maintenance, and
- Purchase land for parks.

3.2. Compliance and Recommendations

Few federal regulations target recreation; one exception is Section 4(f) of the Department of Transportation (DOT) Act of 1966, which is triggered by projects funded by a DOT agency (e.g., UDOT) and that use land from a historic property, publicly owned park, recreation area, or refuge. Recent stakeholder meetings on green infrastructure identified various recreation resources and recommendations (Table 10).

Table 10. Stakeholder Recommendations Regarding Green Infrastructure

Economic development	The Utah economy depends on recreation. Recreational opportunities are a reason that people move here, especially those working in the high-tech sector.
Health and mobility	Trails provide mobility options and long-term health benefits to the community. Local cities should work on active transportation with connected trails/networks and bike lanes.
Connectivity	Trails can connect larger trail systems as well as other recreation elements, e.g., boating. Intermodal hubs are centers of connectivity. Well-planned trailheads and parking lots facilitate connectivity. Currently gaps exist in the Bonneville Shoreline Trail and between Corner Canyon and American Fork Canyon. Improved connectivity enables people to reach destinations via many different means.

Table 10. Stakeholder Recommendations Regarding Green Infrastructure

Jordan River	The Jordan River is underutilized and neglected. We need to revitalize this resource and take advantage of all of the recreational advantages associated with it.
Unique and diverse recreation	A mix of recreation is good, and many recreation user groups can be accommodated. There are opportunities for river utilization (kayaking, canoeing) as well as hiking and paragliding in the study area. The Point of the Mountain (Flight Park State Recreation Area) is a world-class, destination paragliding location. The area's unique geography creates wind-flow patterns that are rare and particularly ideal for this sport. Conflict can result from different recreational and land uses.
Green Space	Planners need to think strategically about where to invest in and develop greenspace, because once it is gone it can't be replaced. There is potential to utilize open space for green energy projects, particularly wind and solar.

4. CULTURAL RESOURCES

4.1. Assessment and Findings

The study area consists of approximately 74,500 acres located on a combination of state, local, and private lands, so depending on whether or not there is a federal nexus, compliance with Section 106 of the National Historic Preservation Act (NHPA) may not be required. If National Environmental Policy Act (NEPA) compliance is required for the proposed project, compliance with Section 106 of the NHPA will be required.

If compliance with Section 106 of the NHPA is not required, compliance with Utah Code 9-8-404 may be required. Compliance with Utah Code 9-8-404 depends on whether state funds will be used for the project or whether the activity will take place on state lands. If state funds are used, state permits will be required. If the project will be on state lands, Utah Code 9-8-404 requires each agency “take into account the effect of the expenditure or undertaking on any historic property” and “provide the state historic preservation officer with a written evaluation of the expenditure’s or undertaking’s effect on the historic property” (Utah State Legislature 2016).

If no state or federal nexus exists, and if the project area is on private land, state involvement that would require compliance with Utah Code 9-8-404 is not expected. Additionally, based on past experience, if Utah state agencies are involved, SWCA expects their involvement to be so minimal that they would not require compliance with Utah Code 9-8-404.

However, even in the absence of federal and state involvement, conditional use permits for the project may require compliance with State History Preservation Office (SHPO) notification requirements and applicable laws in the Utah Code (specifically Utah Code 9-8-307, 76-9-704, and 9-8-309, and Utah Administrative Code 21-4). If archaeological resources are found in the project area, additional precautionary measures could be taken to minimize the risk of potential SHPO consultation beyond the notification requirement. Before project construction, an intensive-level pedestrian survey could be conducted according to SHPO standards for the sewer project, where potential cultural resources were identified during the desktop analysis. If cultural resources are encountered during the survey, they could be documented according to SHPO standards and a short letter report of the findings could be submitted to the SHPO. As stated before, the notification requirement (Utah Code 9-8-307) does not require consultation with SHPO regarding avoidance or treatment of an archaeological site, and it is highly unlikely that SHPO would request further consultation or compliance upon notification. However, if SHPO did request further consultation or treatment of a site, and the client chose to comply with SHPO’s request as a good-faith measure, those activities would occur in advance of project construction and would help avoid costly project delay.

In accordance with notification requirements and applicable laws in Utah Code 76-9-704 and 9-8-309 for discovery of human remains, the following protocol should be implemented to ensure that a discovery of human remains is protected and promptly reported to the local law enforcement.

- Contractors will immediately suspend construction operations near the discovery unless doing so would result in unsafe work conditions. Once conditions are deemed safe, then construction near the discovery will cease.
- Contractors will immediately notify a local law enforcement agency and the landowner.
- As stated in Utah Code 9-8-309 Subsection (1)(a)(ii), the person who owns or controls the land will require that activity in the area of the discovery cease, and they will make a reasonable effort

to protect the discovery until activity may be resumed in accordance with Utah Code 9-8-309 Subsection (1)(d).

- As stated in Utah Code 9-8-309 Subsection (1)(b), if the local law enforcement agency believes, after being notified, that a person may have discovered ancient human remains, the local law enforcement agency will contact the Antiquities Section of the Utah Division of State History.
- Further treatment of the discovery will proceed in accordance with Utah Code 9-8-309.

SWCA performed a desktop analysis to help predict the type and number of cultural resources that may be present in the study area. For the desktop analysis, SWCA reviewed online data from the Utah Division of State History for previously inventoried areas and previously documented archaeological sites and historic properties. In addition, SWCA examined General Land Office plats and several GIS layers for potential cultural resources. These layers, available from state and federal agencies, include National Register of Historic Places (NRHP) properties, Utah historic trails, Utah historic districts, historic topographic maps, and other historic aerial imagery. Historic maps illustrate historic features such as trails, towns, cemeteries, roads, railroads, utility features, mining features, fences, and other structures. Although such map features are not archaeological sites per se, each feature is an indication of a potential cultural resource for which agencies would typically require documentation as an archaeological site if encountered in the project area. This level of analysis satisfies SHPO standards for a file search and can be used to support future inventory and reporting efforts if needed.

In all, 224 previous cultural resource inventories have been conducted in the study area since 1961 (Figure A8, Appendix A). Of the 224 previous inventories, only 116 of them have been conducted with in the last 10 years. Approximately 15% to 20% of the entire study area has ever been inventoried. For a complete list of previous inventories, please see Appendix C.

In all, the study area contains 118 previously documented archaeological sites, of which 41 sites are eligible (34 historic sites, three multicomponent sites; five prehistoric sites) and one is NRHP listed (Table 11). Seventeen sites (five historic and 12 prehistoric) have undetermined NRHP eligibilities. The prehistoric sites consist of lithic scatters, camps and associated lithic scatters, and a fish procurement and processing site. The historic sites consist of irrigation canals and ditches, artifact scatters, homesteads, transmission lines, roads, a power plant, structural remains, railroads, a debris dam, and a bridge. For the multicomponent sites, the prehistoric components consist of camps and/or lithic scatters, while the historic components consist of an artifact scatter, a clay mine, and a possible stage coach route and stop.

Table 11. Previously Documented Archaeological Sites Identified Within the Study Area

Note: NRHP = National Register of Historic Places

[†]Site number was returned to the State Historic Preservation Office and has not been used for any site.

[†]No site form or site data is available from the State Historic Preservation Office.

[†]Site number was cancelled, as the site was the same as 42UT0000795.

•The Pony Express National Historic Trail is considered NRHP-eligible; however, this particular site recording was based on georeferenced maps and has not been verified on the ground.

In all 2,304 previously documented historic properties were identified in the study area. Of these, 765 are NRHP-eligible, and 37 are listed on the NRHP (Table 12). Another 61 historic properties are unevaluated for the NRHP, including the Utah State Prison. For a complete listing of all the eligible or unevaluated properties, please see Appendix D. In addition, two NRHP-listed historic districts were identified: the Riverton Historic District, in Riverton, Utah, and the Lehi Main Street Historic District in Lehi, Utah. Thirty of the previously identified historic properties are part of the historic districts: 25 are part of the Riverton Historic District and five are part of the Lehi Main Street Historic District.

Finally, 66 General Land Office features were identified located within the study area, of which 65 are roads and one is the Jordan Narrows to Bingham Transmission Line (recorded as 42SL000452). Other historic maps and the Salt Lake County linear GIS layer identified 25 linear features in the study area; these consist of canals, railroads, ditches, and the Pony Express National Historic Trail (42SL000498).

Water has always been an important resource in Utah. When settlers moved into the county, identifying sources of water for culinary use, crops, and livestock became a priority. Irrigation canals draw water from the area's rivers and streams to meet watering needs. Present-day Draper is the site of the earliest reference to irrigation water in 1850 in that area (Gardner and Mickelsen 2011:3). In 1859 in the vicinity of South Jordan, the Beckstead Ditch was constructed shortly after settlement with the Jordan River as a source (Bateman 1998:36). The South Jordan Canal was built in 1871 as more settlers moved into the area (Bateman 1998:36). Many other irrigation canals and ditches, including the Welby-Jacob Canal (42UT001449, also known as the Highline Canal or Provo Reservoir Canal), Utah Lake Distributing Canal (42UT000946, also known as the Murdock or "millionaire's ditch"), and the Utah and Salt Lake

Canal (42SL000295 and 42SL000307), share the Jordan River as their water source in the study area (Bateman 1998:36).

Irrigation canals and ditches have been and continue to be important archaeological resources in the study area. In all, 23 irrigation canals, ditches, or canal-related features were identified in the file search. Canals have a variety of construction methods and materials, but they typically consist of a ditch and control features (including headgates, dams, and lateral ditches/canals). The canal-related features may also include pumphouses and siphons. Modern improvements to canals can include piping and burial of the canal; these types of improvement can alter the NRHP eligibility of a canal. SWCA recommends revisits for previously documented NRHP-eligible canal sites that have been piped and buried to determine if NRHP status has changed. All of these resources cross multiple miles across the study area, and even cross counties.

Much like the irrigation canals, railroad alignments stretch across the study area and cross counties. Railroads were integral in interstate and intrastate commerce and helped to make long-distance transportation easier as well by connecting to the Transcontinental Railroad. Five railroads and related branches—Denver and Rio Grande Western Railroad (DRGW) (42SL000293, 42UT001101, and 42UT001125), Union Pacific Railroad (UP) (42SL000344), Salt Lake and Utah Railroad (42SL000510), Salt Lake Western Railroad (42UT000948), and the Utah Southern Railroad (42UT001029)—have been documented within the study area. Many of these sites are only segments of these railroads; therefore, additional documentation of these resources may be required. The UP Railroad connected to the Central Pacific Railroad at Promontory Point to complete the Transcontinental Railroad in 1869. Construction of the other railroads began primarily in the 1870 and 1880s. The UP and the DRGW Railroads were the primary rail lines in the state, hauling freight and passengers. The DRGW came into Utah from Colorado and connected to Salt Lake City, crossing Utah's coal country. The smaller rail lines were built to meet the freighting needs of areas beyond the larger lines, only to be bought out or shut down as a result of bankruptcy.

The NRHP-listed Riverton Historic District is located in the study area on Redwood Road in Riverton, Utah. The district is eligible for the NRHP under Criteria A and C for its connection to exploration and settlement of the area as well as architectural styles in the district. The district is comprised of a 40 primary buildings, with only 30 (75%) contributing (Owen and Roscoe 2004). In addition, 41 secondary outbuildings are associated with the residences; of those, only 14 are contributing (Owen and Roscoe 2004). Including both primary buildings and outbuildings, 44 (54%) are contributing and 37 (46%) are non-contributing, with a total of 81 buildings in the district (Owen and Roscoe 2004).

The NRHP-listed Lehi Main Street Historic District is located in the study area on Main Street in Riverton, Utah. The district is eligible under Criteria A for "its association with and physical representation of Lehi's growth and development through two of the major periods of Lehi's history" (Knight 1998). The district is comprised of 28 buildings, with 19 contributing and 9 non-contributing.

In summary, within the study area, 41 previously documented archaeological sites and 765 historic properties eligible for the NRHP; one previously documented archaeological site and 37 historic properties are NRHP-listed; and 17 previously documented archaeological sites and 61 historic properties are unevaluated for the NRHP. In addition, the study area has potential to contain additional archaeological sites and architectural properties.

4.2. Compliance and Recommendations

Depending on whether there is a federal or state nexus for the proposed project, compliance with Section 106 or Utah Code 9-8-404 may be required. However, if there is no federal or state nexus, the project is not subject to compliance with Section 106 or Utah Code 9-8-404. Therefore, absent local authority, there is no permitting that requires formal inventory, mitigation, or treatment of these cultural resources. Protocols for discovery of human remains outlined previously in this report should be implemented to ensure that human remains are protected and promptly reported to the local law enforcement.

Although it is not required to take measures to minimize impacts to cultural resources if there is no state or federal nexus, the proponent could choose to:

1. Conduct an intensive-level pedestrian survey of the final project footprint to identify and document cultural resources to SHPO standards.
2. Conduct a reconnaissance-level architectural survey of the final project footprint to identify and document historic architecture to SHPO standards.
3. Conduct an intensive-level architectural survey of historic architecture in the final project footprint and document according to SHPO standards as necessary.
4. Prepare a report detailing the survey and findings that meets SHPO standards, and submit the report to SHPO.
5. If significant cultural resources are unexpectedly identified during the survey (i.e., an archaeological site is documented and recommended NRHP eligible even though the desktop analysis has deemed that unlikely), redesign the project to avoid those resources.
6. If significant resources cannot be avoided, develop a treatment plan and conduct mitigation for those sites in consultation with the SHPO.
7. Develop a discovery plan for unexpected cultural resources that may be found subsurface at the time of construction, and implement the discovery plan as necessary.

5. FINAL RISK EVALUATION AND SUMMARY

5.1. Final Risk Evaluation

As a measure of final risk evaluation, SWCA identified risk categories and assigned risk levels based on the potential for each issue to negatively affect the implementation, cost, schedule, and/or permitting for the project (Table 13). Because the risk levels are based entirely on a preliminary evaluation of desktop data, future intensive-level or site-specific studies could reveal new or additional risks (e.g., hazardous materials) or diminish or increase currently identified risk levels.

Table 13. Risk Level Scoring System

Description	Risk Level
No potential issues were identified in the study area.	None
Potential issues were identified in the study area, but the issues would require minimal permitting, compliance, or agency coordination.	Low
Potential issues were identified the study area, and the issues would require some permitting, compliance, or agency coordination, or there is some uncertainty around the resource issue.	Moderate
Potential issues were identified the study area, and the issues would be difficult to address. These issues would require complex permitting processes and extensive agency coordination that could lead to delay or alteration of the project.	High
Potential issues were identified the study area, and issues may exceed agency limitations. These issues would require extensive permitting and agency coordination that could lead to denial of the project.	Fatal flaw

Table 14 summarizes the potential issues that are expected and evaluates the final risk level for the study area based on current available information. The study area has been evaluated for all of the considered resources. It is important to note that future policy changes could influence or change project risks.

Table 14. Potential Issues and Risk Level in the Study Area

Resource	Issue in Study Area (Yes or No)
Waters of the U.S.	Yes
Floodplains	Yes
Federal threatened or endangered wildlife species	Yes
Utah State sensitive wildlife	Yes
Raptors	Yes
Big game species	Yes
Federally listed plant species	Yes
Trails	No
Other recreation	No
Cultural and archaeological resources	Yes
Total potential issues	8
Risk level	Moderate
Critical issues or fatal flaws	No

5.2. Summary

This critical issues analysis resulted in the following conclusions:

- No critical issues or fatal flaws were identified for the study area, assuming that adequate planning would occur to mitigate impacts to natural, recreation, and cultural resources. Mitigation may take many forms, from avoidance to impact minimization to documentation.
- The study area has eight potential issues that will likely require some level of regulatory compliance or planning once specific development strategies are defined.
- The risk level for the study area is only moderate, in so far as the size of the study area has resulted in a larger number of resource issues. Smaller individual projects within the study area will likely involve fewer resource issues.

This critical issues analysis is based entirely on a preliminary evaluation of desktop data. For these reasons, additional intensive-level or site-specific studies could reveal additional risks or could elevate or diminish currently identified risk levels.

Salt Lake City, Utah 84111

Subject: Species of Concern Near the Wildlife Study Area

Dear Brian Nicholson:

I am writing in response to your email dated January 30, 2017 regarding information on species of special concern proximal to the Wildlife Study Area located approximately in Township 3-5 South, Range 1 East-2 West, SLB&M in Salt Lake and Utah Counties, Utah

Within the project area noted above, the Utah Division of Wildlife Resources (UDWR) has recent records of occurrence for long-billed curlew, and historical records of occurrence for American white pelican, burrowing owl, Colombia spotted frog, greater sage-grouse, kit fox, Lewis's woodpecker, short-eared owl and yellow-billed cuckoo. All of the aforementioned species are included on the *Utah Sensitive Species List*.

The information provided in this letter is based on data existing in the Utah Division of Wildlife Resources' central database at the time of the request. It should not be regarded as a final statement on the occurrence of any species on or near the designated site, nor should it be considered a substitute for on-the-ground biological surveys. Moreover, because the Utah Division of Wildlife Resources' central database is continually updated, and because data requests are evaluated for the specific type of proposed action, any given response is only appropriate for its respective request.

In addition to the information you requested, other significant wildlife values might also be present on the designated site. Please contact UDWR's habitat manager for the central region, Mark Farmer, at (801) 491-5653 if you have any questions.

Please contact our office at (801) 538-4759 if you require further assistance.

Sincerely,

Sarah Lindsey
Information Manager
Utah Natural Heritage Program

cc: Mark Farmer
